# Blazor Enhancements in .NET 5.0

## Component Features

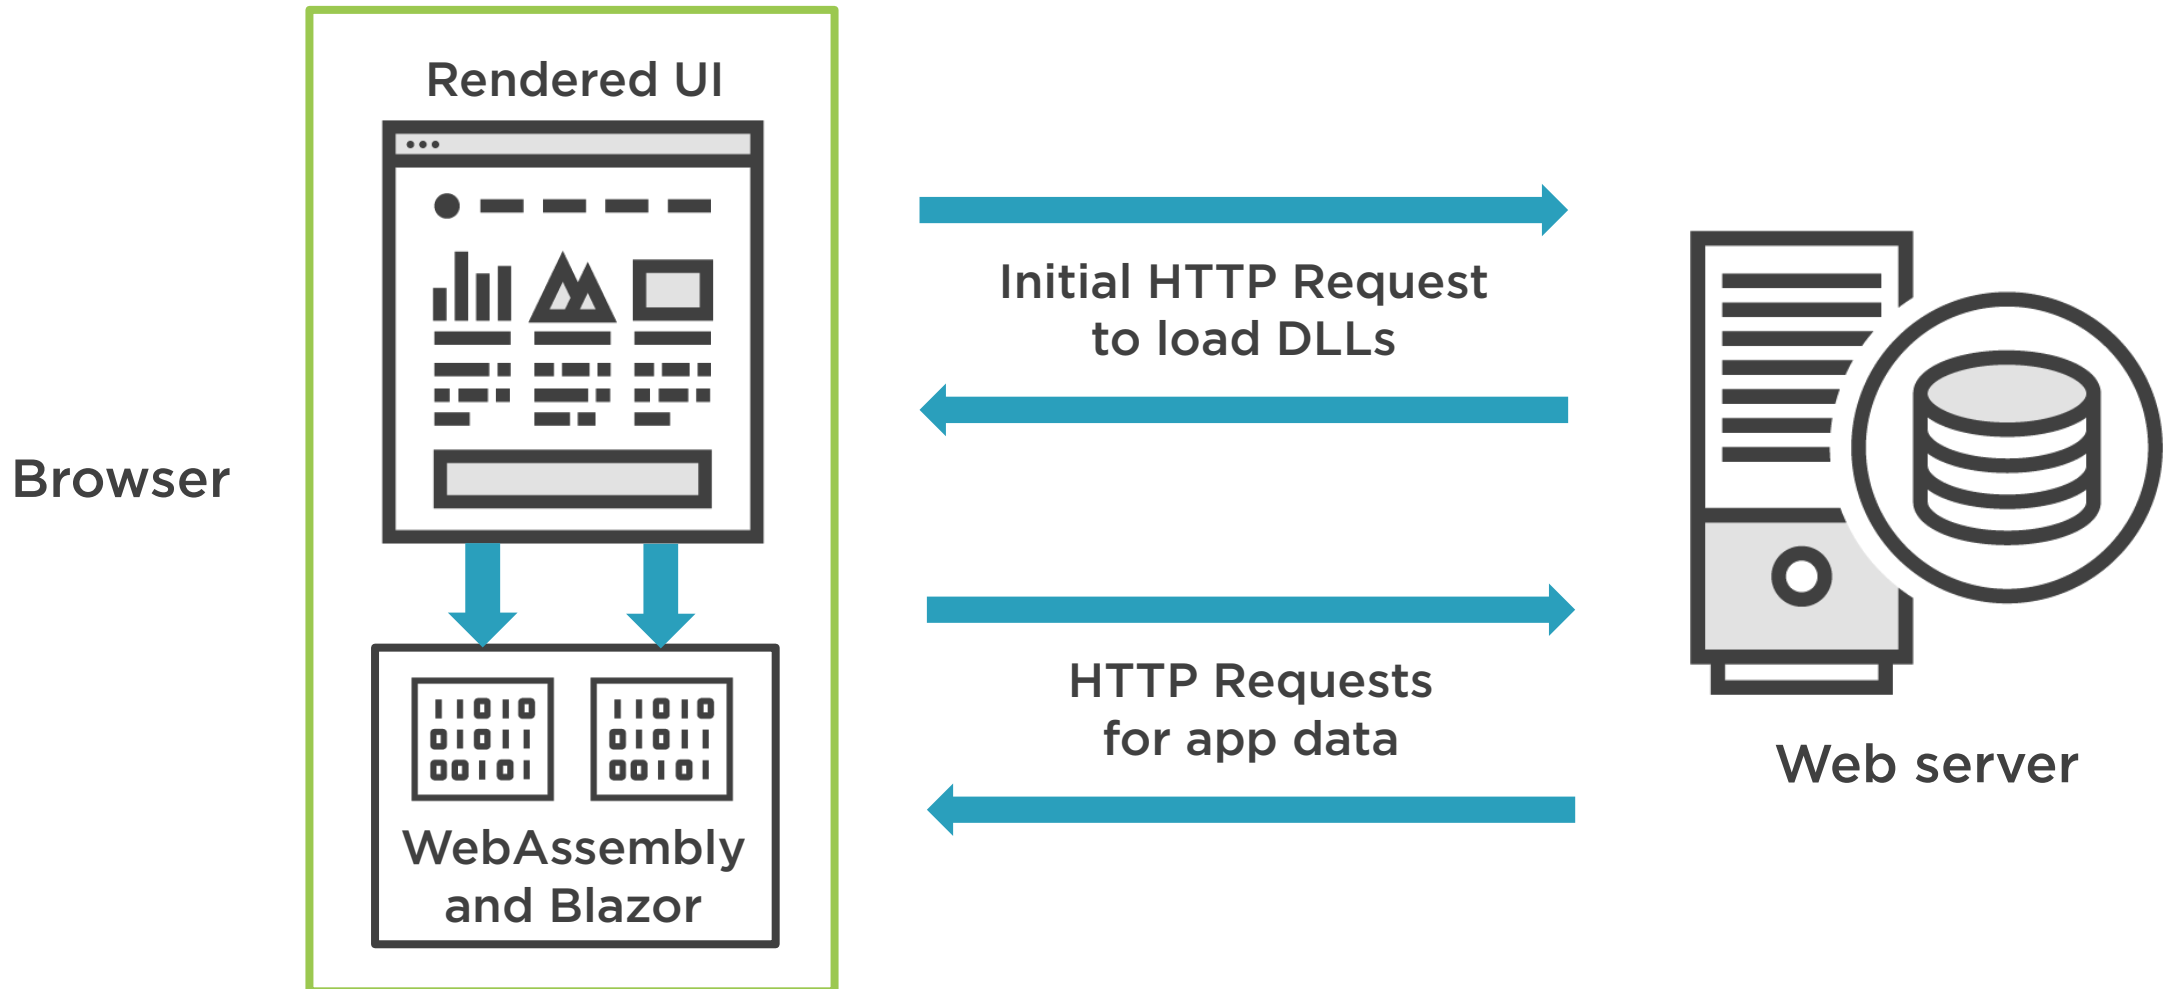

Improve the development experience and feature gaps.

## Performance

Allows apps to run faster and with better stability.

# Understanding Blazor WebAssembly

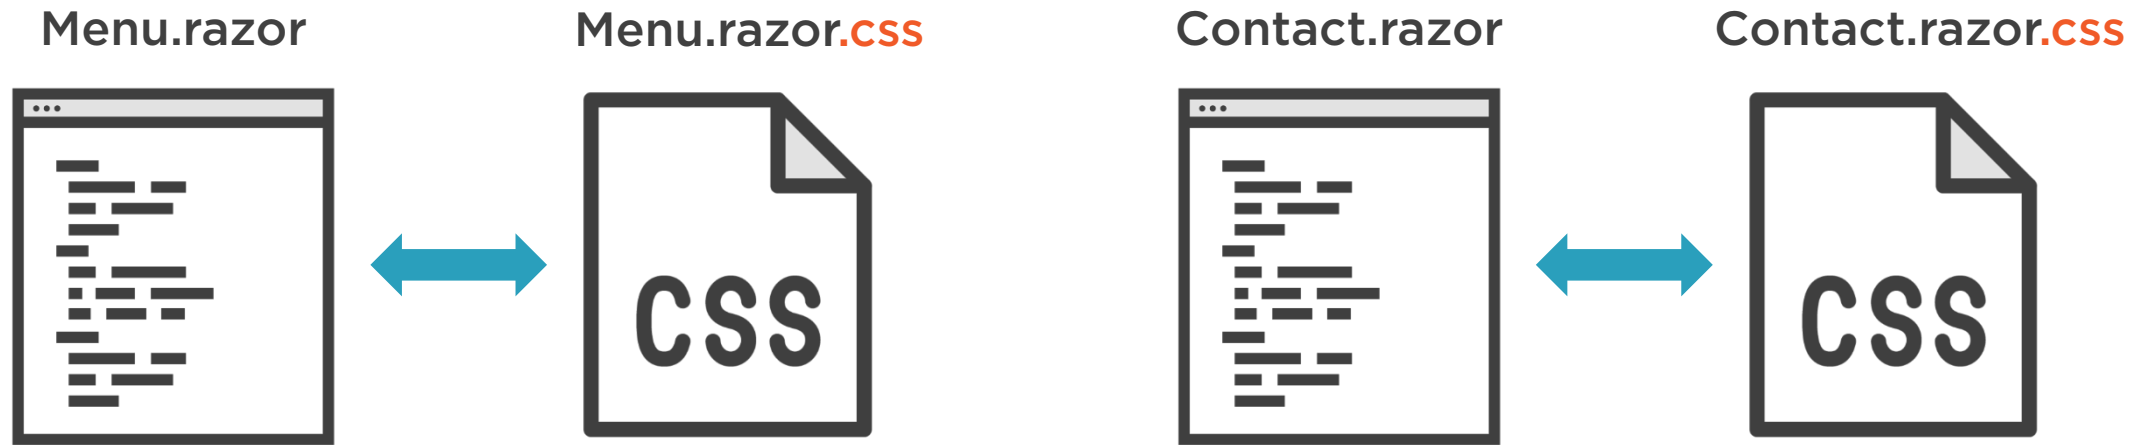

# Understanding Blazor Server

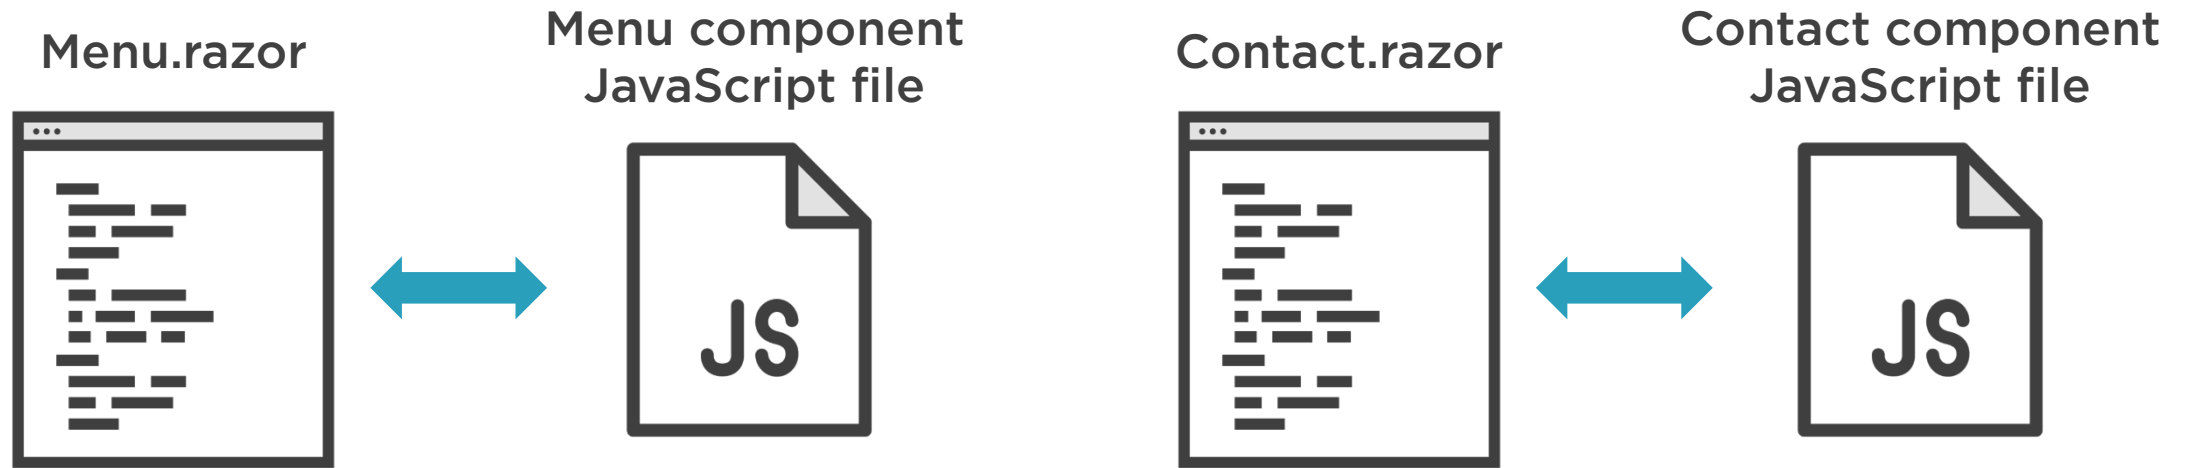

# CSS in Blazor Before .NET 5.0

# Blazor Component CSS Isolation in .NET 5.0

# Blazor Component JavaScript Isolation in .NET 5.0

# Benefits of Code Isolation

**Styles and scripts are scoped to individual components**

**Components and their assets can be easily packaged**

**Component consumers do not have to manually import CSS and JavaScript**

**Smaller, more organized script and CSS files**

# Blazor Form Enhancements

- Radio group and button support
- File uploads
- Customizable validation classes
- DisplayName parameter support
- Input focus helpers

# Additional Features

OnToggle events

Catch-all route parameters

Improve globalization

IAsyncDisposable support

Full release for browser storage packages (Blazor Server)

## JavaScript Isolation with Components

# Reasons to Use JavaScript with Blazor

**Need for libraries  
or code unavailable  
in Blazor**

**Need to reuse  
existing, complex  
JavaScript code**

**Need to fill Blazor  
feature gaps**

# Demo

## CSS Isolation with Components

## Utilizing Isolated Components

## Summary

ASP.NET in .NET 5.0 includes many updates to Blazor components

Dotnet Watch can monitor a project for changes and dynamically recompile the app

The new InputRadio and InputFile components fix feature gaps in Blazor forms

Blazor components now support CSS and JavaScript isolation

JavaScript isolation enables components to import scoped JavaScript modules

CSS isolation uses naming conventions to define component-scoped stylesheets

These isolation features allow for cleaner, more portable packages
